a post-production studio built through close creative collaboration.

working with production teams, agencies, and directors to carry projects through post, supporting where needed and staying closely involved through final delivery.

Each project evolves differently, and the approach is shaped to serve the work and its intended outcome.

Creative Direction

We translate the client’s vision into a clear VFX approach that fits the brand, the brief, and the level of realism the project needs. We help set the art style early so every shot stays consistent from concept through final delivery.

Research + Look Development

We explore references, test techniques, and build early look development to lock the visual direction. The goal is clarity before cameras roll, so the team stays aligned and production moves fast.

Technical Planning

We align with production on on-set capture needs and shot requirements, prepping the team with shot notes, tracking and lens data, and the right reference for lighting and integration. It keeps post clean and controlled.

Full-Shot Execution

We take ownership from matchmove and layout through asset build, simulation, and CG integration, keeping the work consistent across the full sequence. We keep shots organized, versioned, and review-ready so feedback moves fast.

Environments, Set Extensions + Simulation

We build digital environments and extensions, paired with simulations that add scale, realism, and physical detail where it matters. Every element is built to match camera, lighting, and the real-world plate.

Compositing + Paint

We bring every element together through compositing, cleanup, beauty, roto and paint, balancing light, texture, and continuity for a seamless final frame. Final frames are dialed for realism, clarity, and consistency shot-to-shot.

Beauty + Cleanup

We handle beauty work and cleanup at the final stage, refining details that distract from the frame. Roto, paint, polish, and continuity fixes are treated with the same care as the main VFX so the shot feels finished, not touched.

AI-Assisted Workflows

We integrate AI where it improves speed and iteration, while keeping realism and control intact. It supports VFX tasks like cleanup, detail work, and versioning, without compromising the final look.

Sound

Full sound production from sound design through mix and composition, with original foley when needed. We build the sonic layer to match the visual tone, elevate the story, and deliver a complete final experience.

CASE STUDIES

Storyboard

Rory Mcilroy
RBC Canadian Open

With no live shoot possible, the client asked us to develop the creative direction and bring the concept to life.

We crafted a stylized 3D hype reel, taking the project from concept art through to final execution. Throughout the process, the client remained closely involved, providing notes and feedback as we shaped the visuals to capture Rory’s momentum and the anticipation around the tournament.

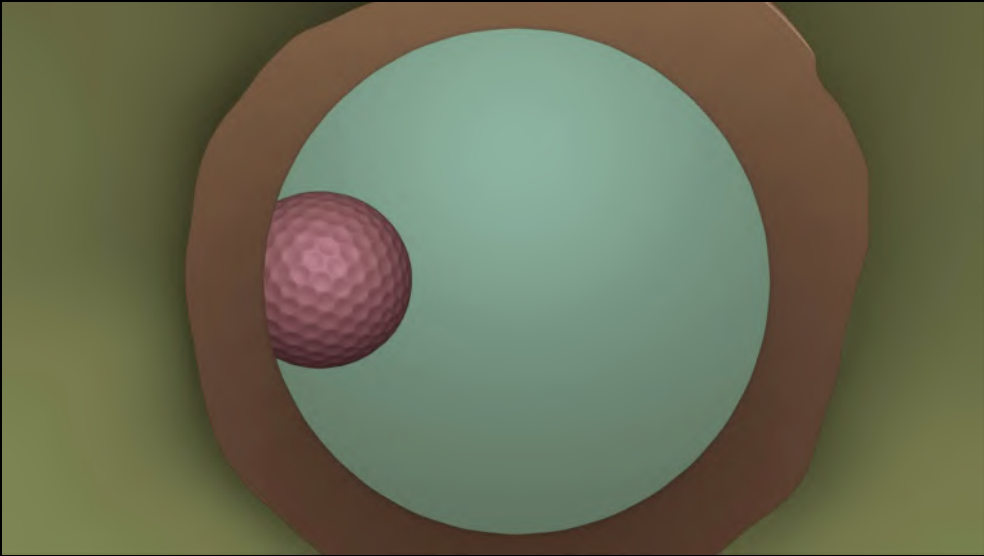

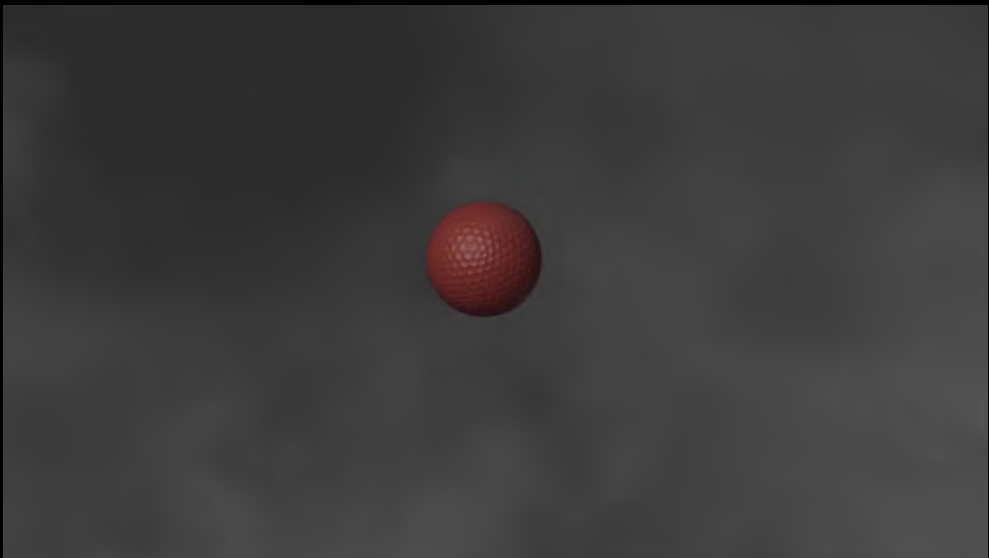

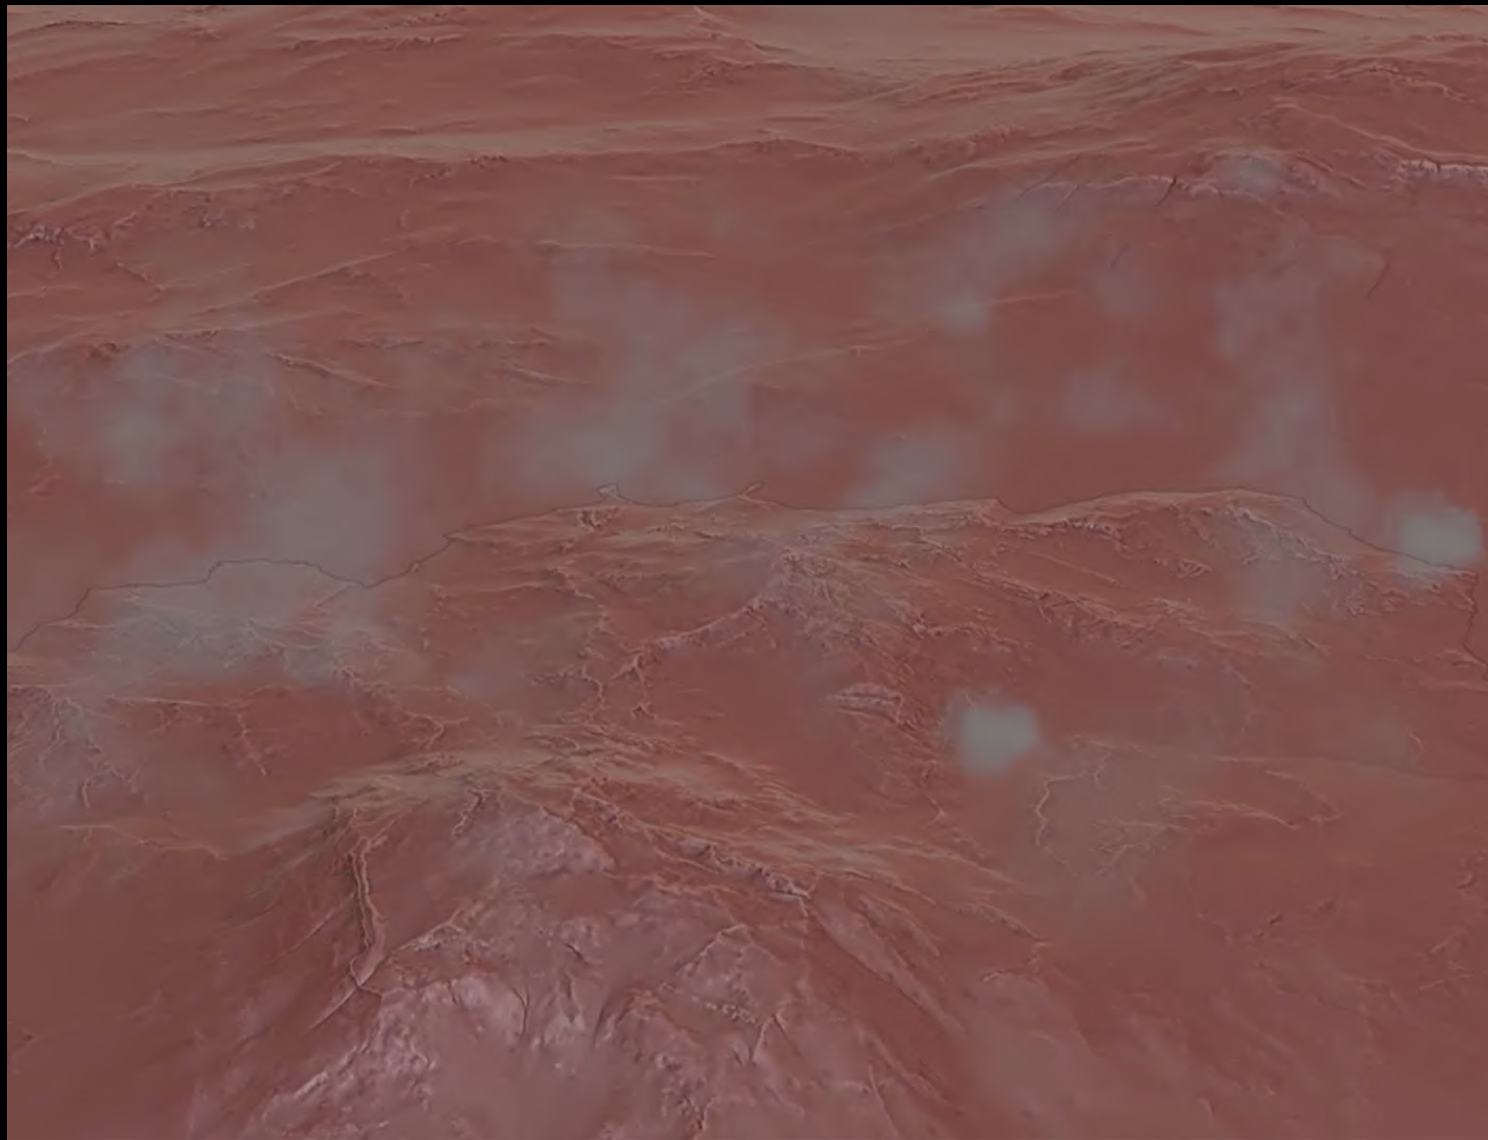

Pre-visualization

Rory Mcilroy
RBC Canadian Open

Before moving into final production, we built a full pre-vis to map out pacing, camera moves, and overall flow.

This stage gave the client a clear first look at how the story would unfold on screen. By reviewing timing, framing, and energy early on, they were able to provide detailed notes and shape the direction with us. The pre-vis ensured everyone was aligned creatively before resources went into final rendering and polish.

Asset Prep

Rory Mcilroy
RBC Canadian Open

The client asked that specific elements be featured within the reel to tie back to Rory and the tournament.

We developed 3D assets for the Osprey bird (a nod to the course), Rory's championship ring, the custom Rory gold ball, and the RBC Canadian Open trophy. Each was designed and integrated to enhance the narrative while aligning with the overall creative direction.

Enviroment

Rory Mcilroy
RBC Canadian Open

Since no shoot was possible, we relied on archival footage of Rory and rebuilt the tournament setting digitally.

Using detailed golf course maps as a base, we laid out and modeled the landscapes of Osprey Valley. From there, we re-created and enhanced the textures, rebuilt surfaces, and scattered nature elements to bring the environments to life. The result was a set of realistic, fully CG environments that replicated the real course while still supporting the stylized, cinematic direction of the reel.

Reference

Rory Mcilroy
RBC Canadian Open

The client provided detailed references of Osprey Valley, which we used as the foundation for the build.

These materials ensured the environments were accurate to the real course and helped us deliver a CG space that feels authentic and true to the tournament setting.

CRAFT

Creative Development

Visual direction, structure, and shot logic are established before production begins. Storyboards and early visual exploration define composition, pacing, and technical feasibility, ensuring clarity across production and post.

CG Intergration

CG elements are embedded into live-action plates using accurate camera tracking, lens calibration, and scene lighting. Surface interaction, shadow behavior, and material response are refined to ensure consistency across motion, grading, and final delivery.

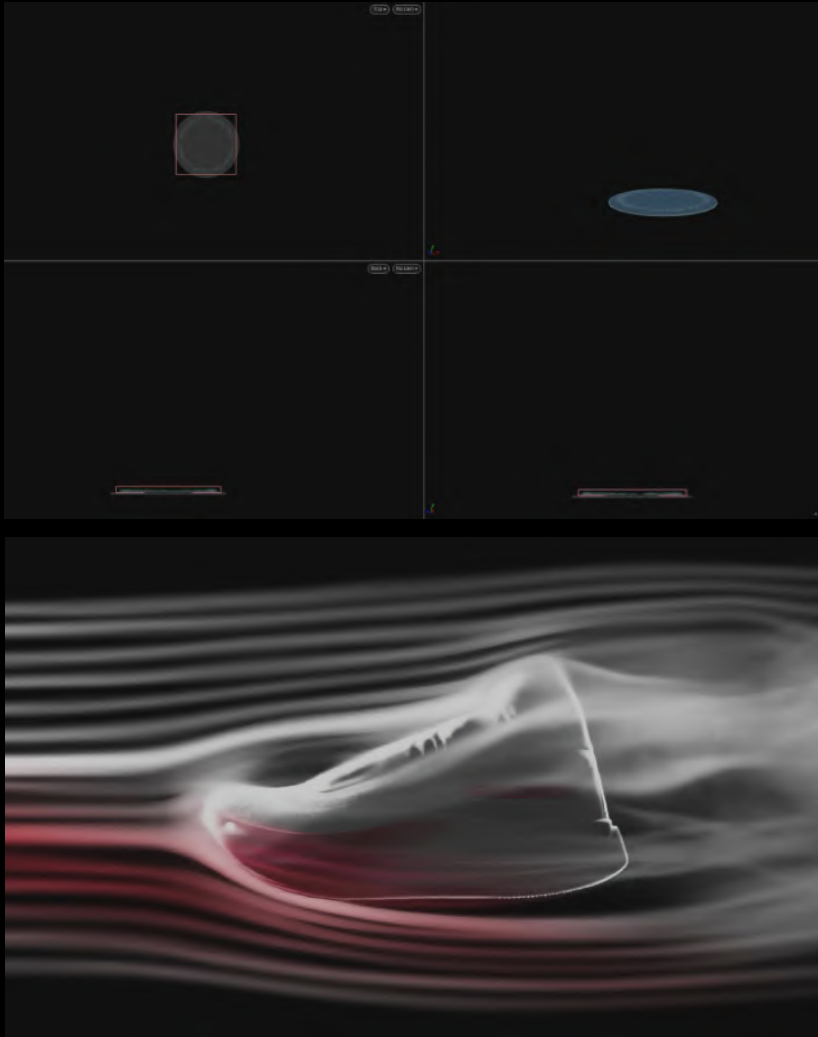

CG Environments

at any scale, from full digital builds to set extensions and enhancements. We recreate real locations or design new spaces to match the project's tone, with careful attention to scale, lighting, perspective, and atmosphere. Every environment is built for seamless integration across the sequence

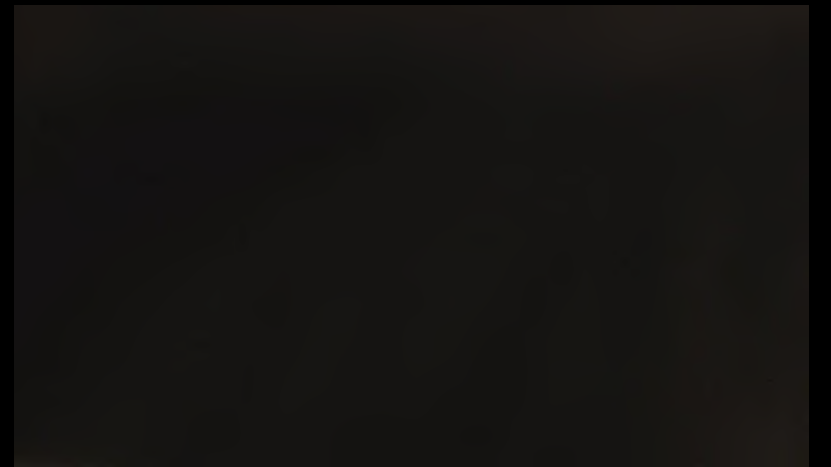

Simulation and FX

Physical motion and environmental interaction are developed using accurate scale, timing, and force behavior. Simulations are refined to respond naturally within the scene and remain consistent across camera perspective and integration.

Compositing

Live-action and rendered elements are unified through precise control of depth, exposure, color space, and optical response. Integration is refined at the pixel level to ensure visual continuity across the entire sequence.

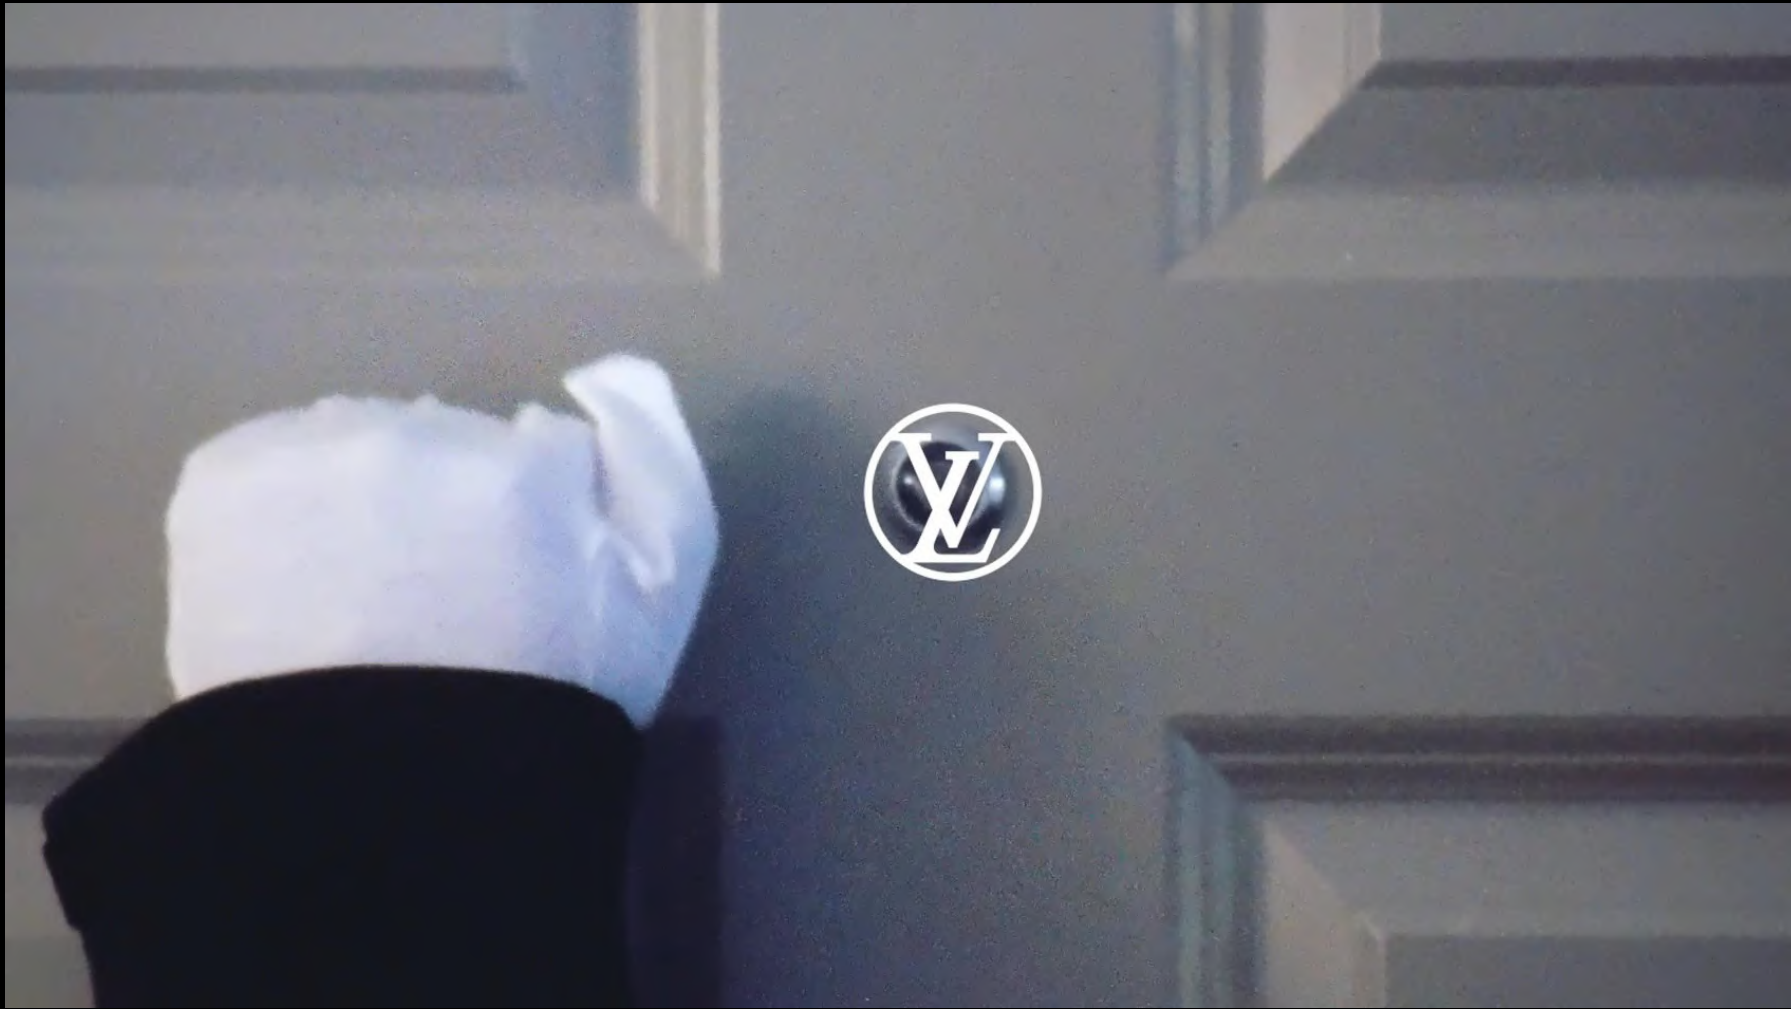

Polish

cleanup, beauty work, and set extensions as part of finishing, refining continuity and removing distractions that pull focus. From subtle fixes to larger extensions, The result is a clean, cohesive finish that holds up across the sequence and delivers to spec.

Sound

Sound defines space, atmosphere, and emotional weight within the frame. From subtle environmental detail to full cinematic design, every layer is shaped to support the image and reinforce its presence.

AI-Assisted Workflow

We integrate AI into live-action and CG workflows as a controlled extension of our process. It allows us to explore, iterate, and build imagery that would otherwise be difficult or time-intensive, while keeping every decision guided by artists. AI remains a tool, supporting realism, precision, and creative intent, never replacing it.

Our Focus

Early Development

Full-Shot Execution

Final polish

From early development and look exploration to full-shot execution and final polish.

R

Samry (+ XYZ team) - I'm so glad I got connected with you guys this year. Y'all truly have the gift of understanding a vision and executing on it. You make things easy, and that's every director's / production co.'s dream. 2026 will be a huge year for the both of us I can feel it. Cheers to a new chapter and to many more to come. Hope to meet you soon one day 😊 - Jack

How We Work

Each collaboration begins with alignment and develops through shared intent and consistent execution.

Our involvement adapts to the needs of each project. Some collaborations last a single project. Others continue for years.
